### **U.S. House Prices Rise 1.4 Percent in Fourth Quarter** **FHFA House Price Index Shows Increases for Fourteen Consecutive Quarters**

**Washington, D.C.** – U.S. house prices rose **1.4 percent** in the fourth quarter of 2014 according to the Federal Housing Finance Agency (FHFA) House Price Index (HPI). This is the fourteenth consecutive quarterly price increase in the purchase-only, seasonally adjusted index. FHFA's seasonally adjusted monthly index for December was up **0.8 percent** from November.

House prices rose **4.9 percent** from the fourth quarter of 2013 to the fourth quarter of 2014. The HPI is calculated using home sales price information from mortgages sold to, or guaranteed by, Fannie Mae and Freddie Mac.

“Contrary to prior indications of a possible slowdown, home price appreciation in the fourth quarter was relatively strong,” said FHFA Principal Economist Andrew Leventis. “The key drivers of appreciation over the last few years—low inventories of homes available for sale and improvement in labor markets—likely played a role in driving up prices during the quarter.”

FHFA’s **expanded-data** house price index, a metric that adds transaction information from county recorder offices and the Federal Housing Administration to the HPI data sample, rose 1.3 percent over the prior quarter. Over the last year, that index is up 6.0 percent. For individual states, price changes reflected in the expanded-data measure and the traditional purchase-only HPI are compared on pages 17-19 of this report.

The seasonally adjusted, purchase-only HPI rose 4.9 percent from the fourth quarter of 2013 to the fourth quarter of 2014 while prices of other goods and services rose only 0.4 percent. The inflation-adjusted price of homes rose approximately 4.5 percent over the latest year.

#### **Significant Findings:**

- Between the fourth quarter of 2013 and the fourth quarter of 2014, the seasonally adjusted, purchase-only HPI rose in 48 states and the District of Columbia. The top five areas in annual appreciation: 1) District of Columbia: 12.5 percent; 2) Nevada: 9.0 percent; 3) North Dakota: 8.4 percent; 4) Colorado: 7.9 percent; and 5) Michigan: 7.8 percent.

- As measured with purchase-only indexes for the 100 most populated metropolitan areas in the U.S., fourth quarter price increases were greatest in the San Francisco-Redwood City-South San Francisco, CA area, where prices increased by 6.0 percent. Prices were weakest in the El Paso, TX MSA, where they fell 6.6 percent.
- Of the nine census divisions, the Mountain division experienced the strongest increase in the fourth quarter, posting a 1.8 percent quarterly increase and a 5.5 percent increase since last year. House price appreciation was weakest in the New England division, where prices fell .03 percent.
- The monthly seasonally adjusted, purchase-only index for the U.S. has increased for 23 of the last 24 months (November 2013 showed a decrease).

FHFA's "distress-free" house price indexes, which are published for 12 large metropolitan areas (page 33), have shown lower quarterly appreciation in the last several quarters than FHFA's traditional purchase-only indexes. In more than half of the areas covered, the new series—which removes short sales and sales of bank-owned properties—shows lower quarterly appreciation than the purchase-only series in the fourth quarter.

The complete list of state appreciation rates is on pages 13-14. The list of metropolitan area appreciation rates computed in a purchase-only series is on pages 30-33. Appreciation rates for the all-transactions metropolitan area indexes are on pages 34-49.

### **Publication of New Indexes**

With this quarter's release, FHFA is publishing a set of experimental house price indexes for three-digit ZIP codes across the country. Three-digit ZIP codes, which include properties having the same first three digits in their standard five-digit ZIP codes, are sometimes used to identify the location of properties in large mortgage datasets. The new indexes may be valuable to analysts who work with such data because it provides information about regional home price movements. Details about the new measures are provided in a "Technical Note" in this report on page 20.

### **Background**

FHFA's purchase-only and all-transactions HPI track average house price changes in either repeat sales or refinancings on the same single-family properties. The purchase-only index is based on more than 7 million repeat sales transactions, while the all-transactions index includes more than 51 million repeat transactions. Both indexes are based on data obtained from Fannie Mae and Freddie Mac for mortgages originated over the past 39 years.

### **Note**

- The next monthly index (including data through January 2015) will be released March 24, 2015.
- The next quarterly HPI report, which will include data for the first quarter of 2015, will be released May 26, 2015.
- Future HPI release dates for 2015 are available on the [House Price Index page](#).
- Follow @FHFA on Twitter for more HPI news.

## Four-Quarter Price Change by State: Purchase-Only Index (Seasonally Adjusted)

U.S. Four-Quarter Appreciation = 4.9% (2013Q4-2014Q4)

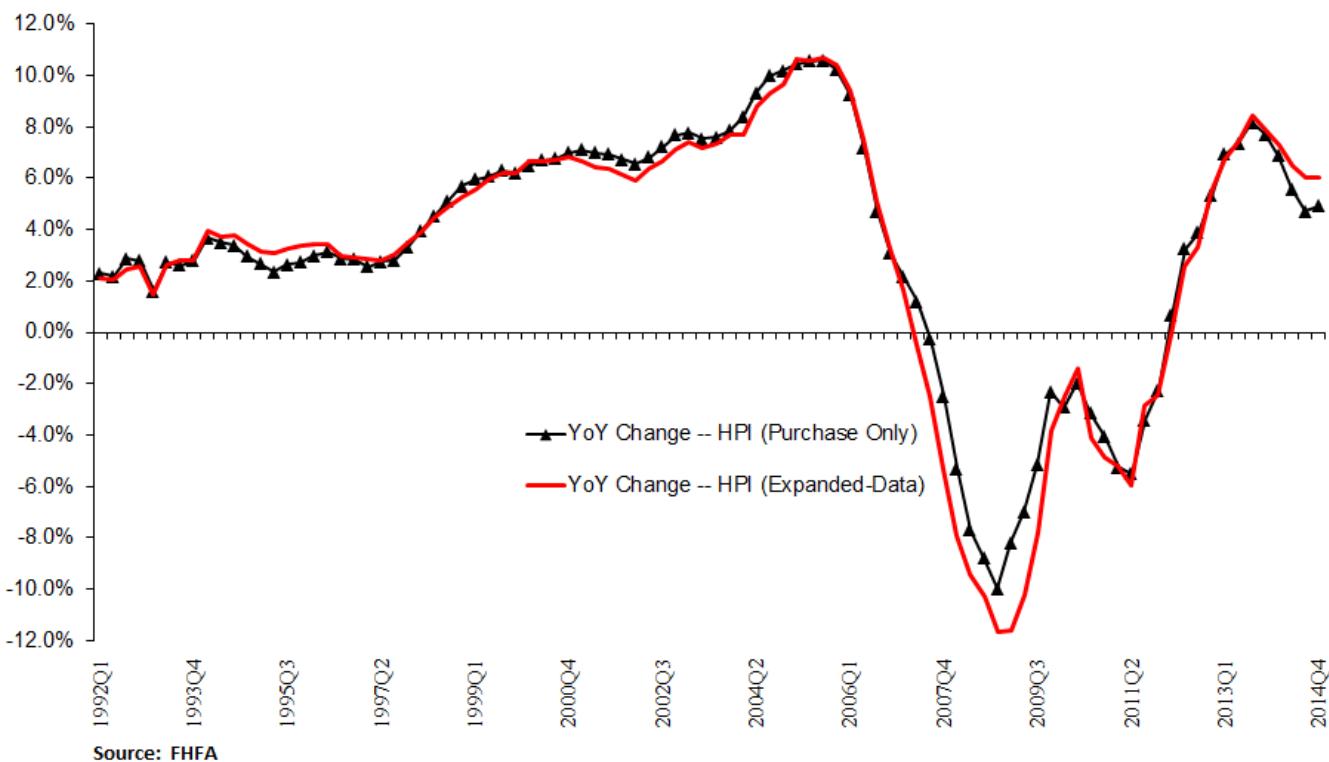

## Comparison of the Purchase-Only and Expanded-Data House Price Indexes

FHFA publishes an “expanded-data” House Price Index (HPI) which is available for 50 states, census divisions, and the United States. The expanded-data HPI is estimated using an augmented dataset relative to the data used to estimate the purchase-only HPI. Like the purchase-only series, the expanded-data series includes sales price information from purchase-money mortgages guaranteed by Fannie Mae and Freddie Mac (the Enterprises). It also includes, however, sales prices for homes financed with Federal Housing Administration-endorsed purchase-money mortgages as well as county recorder data licensed from CoreLogic.

The figure below compares four-quarter percent changes in prices for the purchase-only and expanded-data series since 1992. Although the two series have diverged occasionally, the long-term trend for both is the same. Over the last four quarters, the purchase-only series has risen 4.9 percent, a slightly lower appreciation rate compared to the 6.0 percent increase for the expanded-data series.

A comparison of the purchase-only and expanded-data indexes for census divisions and states is supplied later in this report (where price changes are reported for such areas). The underlying data for the purchase-only and expanded-data HPI can be found at <http://www.fhfa.gov/DataTools/Downloads/Pages/House-Price-Index-Datasets.aspx#qpo>.

## HPI Technical Note

### Release of New Indexes for Three-Digit ZIP Codes

FHFA's house price indexes are sometimes used to approximate the current value of properties that act as mortgage collateral. Using loan-level data with sales prices and appraisal values for individual homes, analysts derive updated value estimates by assuming that the property values have changed by the same percentage as the applicable house price index for the local area. Although imprecise, the updated values are used to evaluate market conditions and measure mortgage risk.

When choosing the applicable index to use for updating home values, analysts use information about the location of the properties. Depending on the geographic information available in the data, analysts may evaluate price changes for the ZIP codes or cities in which the collateral properties are located. Some published mortgage datasets show the "three-digit" ZIP code of the collateral properties, where the three-digit ZIP code is merely the first three digits of the applicable five digit code. For example, a property whose ZIP code is 91711 would be in the "917" three-digit ZIP code. Three-digit ZIP codes represent larger geographic areas than five-digit ZIP codes.

To aid modelers who have three-digit ZIP codes, FHFA has released a set of experimental house price indexes for such areas. These new indexes have been produced under the same "repeat-transactions" methodology as is used to produce the standard HPI. The underlying information used for calibrating the indexes is the "all-transactions" dataset, meaning that the new measures are estimated using sales prices and appraisal values for properties with mortgages guaranteed by Fannie Mae and Freddie Mac.

The new data file is available on the HPI Downloadables page at <http://www.fhfa.gov/DataTools/Downloads/Pages/House-Price-Index-Datasets.aspx#qat>. When reviewing the indexes, users will note that, for some three-digit ZIP codes, relatively small sample sizes would make the three-digit ZIP code indexes highly volatile and not particularly useful. In such cases, the three-digit ZIP index is replaced with the all-transactions index for the applicable Metropolitan Statistical Area. In cases where the three-digit ZIP code is in a rural location, the applicable "nonmetropolitan" area index for the state has been substituted. The downloadable data file identifies, for each three-digit ZIP code, whether the index represents the native three-digit ZIP-level index or one of the two replacements (the MSA or nonmetropolitan-area indexes).<sup>1</sup>

Users will note that, once the native three-digit ZIP code is released for a given three-digit ZIP code, future index releases will always show the native three-digit ZIP code index. That is—for any given ZIP code, once the native three-digit ZIP index is shown, users can assume that future index releases will always show the native local-area index.

---

<sup>1</sup> Where three-digit ZIP codes cross MSA boundaries and the MSA-level index is shown, the selected MSA is the one with the greatest historical transaction volume (i.e., the most loans guaranteed by Fannie Mae and Freddie Mac).

# HOUSE PRICE INDEX

## FREQUENTLY ASKED QUESTIONS

*(updated February 26, 2015)*

### **1. What is the value of the House Price Index (HPI)?**

The HPI is a broad measure of the movement of single-family house prices. It serves as a timely, accurate indicator of house price trends at various geographic levels. It also provides housing economists with an analytical tool that is useful for estimating changes in the rates of mortgage defaults, prepayments and housing affordability in specific geographic areas. The HPI is a measure designed to capture changes in the value of single-family houses in the U.S. as a whole, in various regions and in smaller areas. The HPI is published by the Federal Housing Finance Agency (FHFA) using data provided by Fannie Mae and Freddie Mac. The Office of Federal Housing Enterprise Oversight (OFHEO), one of FHFA's predecessor agencies, began publishing the HPI in the fourth quarter of 1995.

### **2. What transactions are covered in the HPI?**

The House Price Index is based on transactions involving conforming, conventional mortgages purchased or securitized by Fannie Mae or Freddie Mac. Only mortgage transactions on single-family properties are included. Conforming refers to a mortgage that both meets the underwriting guidelines of Fannie Mae or Freddie Mac and that does not exceed the conforming loan limit. For loans originated in the first nine months of 2011, the loan limit was set by Public Law 111-242. That law, in conjunction with prior legislation, provided for loan limits up to \$729,750 for one-unit properties in certain high-cost areas in the contiguous U.S. Mortgages originated after September 30, 2011 were no longer subject to the terms of prior initiatives and, under the formula established under the Housing and Economic Recovery Act of 2008, the "ceiling" limit for one-unit properties in the contiguous U.S. fell to \$625,500. The current conforming loan limit is \$417,000 in most of the U.S.

Conventional mortgages are those that are neither insured nor guaranteed by the FHA, VA, or other federal government entities. Mortgages on properties financed by government-insured loans, such as FHA or VA mortgages, are excluded from the HPI, as are properties with mortgages whose principal amount exceeds the conforming loan limit. Mortgage transactions on condominiums, cooperatives, multi-unit properties, and planned unit developments are also excluded.

### **3. How is the HPI computed?**

The HPI is a weighted, repeat-sales index, meaning that it measures average price changes in repeat sales or refinancings on the same properties. This information is obtained by reviewing repeat mortgage transactions on single-family properties whose mortgages have been purchased or securitized by Fannie Mae or Freddie Mac since January 1975. The HPI is updated each quarter as additional mortgages are purchased

or securitized by Fannie Mae and Freddie Mac. The new mortgage acquisitions are used to identify repeat transactions for the most recent quarter and for each quarter since the first quarter of 1975.

#### **4. How often is the HPI published?**

A comprehensive report is published every three months, approximately two months after the end of the previous quarter. Beginning in March 2008, OFHEO (one of FHFA's predecessor agencies) began publishing monthly indexes for census divisions and the U.S. FHFA continues publishing and updating these indexes each month.

#### **5. How is the HPI updated?**

Each month, Fannie Mae and Freddie Mac provide FHFA with information on their most recent mortgage transactions. These data are combined with the data from previous periods to establish price differentials on properties where more than one mortgage transaction has occurred. The data are merged, creating an updated historical database that is then used to estimate the HPI.

#### **6. How do I interpret “four-quarter,” “one-year,” “annual,” and “one-quarter” price changes?**

The “four-quarter” percentage change in home values is simply the price change relative to the same quarter one year earlier. For example, if the HPI release is for the second quarter, then the “four-quarter” price change reports the percentage change in values relative to the second quarter of the prior year. It reflects the best estimate for how much the value of a typical property increased over the four-quarter period (FAQ #2 reports the types of properties included in this estimate). “One-year” and “annual” appreciation are used synonymously with “four-quarter” appreciation in the full quarterly HPI releases.

Similar to the “four-quarter” price changes, the “one-quarter” percentage change estimates the percentage change in home values relative to the prior quarter. Please note that, in estimating the quarterly price index, all observations within a given quarter are pooled together; no distinction is made between transactions occurring in different months. As such, the “four-quarter” and “one-quarter” changes compare typical values throughout a quarter against valuations during a prior quarter. The appreciation rates do not compare values at the end of a quarter against values at the end of a prior quarter.

#### **7. How are Metropolitan Statistical Areas (MSAs) and Metropolitan Divisions defined and what criteria are used to determine whether an MSA index is published?**

MSAs are defined by the Office of Management and Budget (OMB). If specified criteria are met and an MSA contains a single core population greater than 2.5 million, the MSA is divided into Metropolitan Divisions. The following MSAs have been divided into

Metropolitan Divisions: Boston-Cambridge-Newton, MA-NH; Chicago-Naperville-Elgin, IL-IN-WI; Dallas-Fort Worth-Arlington, TX; Detroit-Warren-Dearborn, MI; Los Angeles-Long Beach-Anaheim, CA; Miami-Fort Lauderdale-West Palm Beach, FL; New York-Newark-Jersey City, NY-NJ-PA; Philadelphia-Camden-Wilmington, PA-NJ-DE-MD; San Francisco-Oakland-Hayward, CA; Seattle-Tacoma-Bellevue, WA; Washington-Arlington-Alexandria, DC-VA-MD-WV. For these MSAs, FHFA reports data for each Division, rather than the MSA as a whole.

FHFA requires that an MSA (or Metropolitan Division) must have at least 1,000 total transactions before it may be published. Additionally, an MSA or Division must have had at least 10 transactions in any given quarter for that quarterly value to be published. Blanks are displayed where this criterion is not met.

## **8. Does FHFA use the February 2013 revised Metropolitan Statistical Areas (MSAs) and Divisions?**

Yes, FHFA uses the revised Metropolitan Statistical Areas (MSAs) and Divisions as defined by the Office of Management and Budget (OMB) in February 2013. These MSAs and Divisions are based on Census data. According to OMB, an MSA comprises the central county or counties containing the core, plus adjacent outlying counties having a high degree of social and economic integration with the central county as measured through commuting. For information about the current MSAs, please visit: <http://www.whitehouse.gov/sites/default/files/omb/bulletins/2013/b-13-01.pdf>.

Prior to the second quarterly release in 2013, FHFA produced metropolitan area indexes based on the December 2009 delineations provided by the OMB at <http://www.whitehouse.gov/omb/assets/bulletins/b10-02.pdf>. That quarter's Highlights piece explains the transition from the December 2009 to the February 2013 definitions. HPIs constructed from both the 2009 and 2013 delineations are available on the Downloadable Data page under the "Additional Data" section then the "Utility Files and Background Information for Index Construction" subsection.

## **9. What geographic areas are covered by the House Price Index?**

The HPI includes indexes for all nine census divisions, the 50 states and the District of Columbia, and every Metropolitan Statistical Area (MSA) in the U.S., excluding Puerto Rico. OMB recognizes 381 MSAs, 11 of which are subdivided into a total of 31 Metropolitan Divisions. As noted earlier, FHFA produces indexes for the divisions where they are available, in lieu of producing a single index for the MSA. In total, 401 indexes are released: 370 for the MSAs that do not have Metropolitan Divisions and 31 Division indexes. The starting dates for indexes differ and are determined by a minimum transaction threshold; index values are not provided for periods before at least 1,000 transactions have been accumulated.

In each release, FHFA publishes rankings and quarterly, annual, and five-year rates of changes for the MSAs and Metropolitan Divisions that have at least 15,000 transactions

over the prior 10 years. In this release, 275 MSAs and Metropolitan Divisions satisfy this criterion. For the remaining areas, MSAs and Divisions, one-year and five-year rates of change are provided.

## **10. What is the methodology used by FHFA in computing the Index?**

The methodology is a modified version of the Case-Shiller® geometric weighted repeat-sales procedure. A detailed description of the HPI methodology is available upon request from FHFA at (202) 649-3195 or online at: <http://go.usa.gov/8BBT>.

## **11. How does the HPI differ from the S&P/Case-Shiller® Home Price indexes?**

Although both indexes employ the same fundamental repeat-valuations approach, there are a number of data and methodology differences. Among the dissimilarities:

- a. The S&P/Case-Shiller indexes only use purchase prices in index calibration, while the all-transactions HPI also includes refinance appraisals. FHFA's purchase-only series is restricted to purchase prices, as are the S&P/Case-Shiller indexes.
- b. FHFA's valuation data are derived from conforming, conventional mortgages provided by Fannie Mae and Freddie Mac. The S&P/Case-Shiller indexes use information obtained from county assessor and recorder offices.
- c. The S&P/Case-Shiller indexes are value-weighted, meaning that price trends for more expensive homes have greater influence on estimated price changes than other homes. FHFA's index weights price trends equally for all properties.
- d. The geographic coverage of the indexes differs. The S&P/Case-Shiller National Home Price Index, for example, does not have valuation data from 13 states. FHFA's U.S. index is calculated using data from all states.

For details on these and other differences, consult the HPI Technical Description (see <http://go.usa.gov/8BBT>) and the S&P/Case-Shiller methodology materials (see <http://us.spindices.com/documents/methodologies/methodology-sp-cs-home-price-indices.pdf>).

A paper that analyzes in detail the methodological and data differences between the two price metrics can be accessed at <http://go.usa.gov/8BBJ>.

## **12. How does the House Price Index differ from the Census Bureau's Constant Quality House Price Index (CQHPI)?**

The HPI published by FHFA covers far more transactions than the Commerce Department survey. The CQHPI covers sales of new homes and homes for sale, based on a sample of about 14,000 transactions annually, gathered through monthly surveys.

The quarterly all-transactions HPI is based on more than 51 million repeat transaction pairs over 39 years. This gives a more accurate reflection of current property values than the Commerce Department index. The HPI also can be updated efficiently using data collected by Fannie Mae and Freddie Mac in the normal course of their business activity.

**13. Where can I access MSA index numbers and standard errors for each year and quarter?**

In addition to the information displayed in the MSA tables, FHFA makes available MSA indexes and standard errors. The data are available in ASCII format and may be accessed at <http://go.usa.gov/8kXz>.

**14. What role do Fannie Mae and Freddie Mac play in the House Price Index?**

FHFA uses data supplied by Fannie Mae and Freddie Mac in compiling the HPI. Each of the Enterprises had previously created a weighted repeat-transactions index based on property matches within its own database. In the first quarter of 1994, Freddie Mac began publishing the Conventional Mortgage Home Price Index (CMHPI). The CMHPI was jointly developed by Fannie Mae and Freddie Mac. The CMHPI series covers the period 1970 to the present.

**15. Why is the HPI based on Fannie Mae or Freddie Mac mortgages?**

FHFA has access to this information by virtue of its role as the federal regulator responsible for these government-sponsored enterprises. Chartered by Congress for the purpose of creating a reliable supply of mortgage funds for homebuyers, Fannie Mae and Freddie Mac are the largest mortgage finance institutions in the U.S. representing a significant share of total outstanding mortgages.

**16. When are the indexes normalized in the downloadable ASCII data?**

The ASCII data for metropolitan areas are normalized to the first quarter of 1995. That is, the HPI equals 100 for all MSAs in the first quarter of 1995. States and divisions are normalized to 100 in the first quarter of 1980. The purchase-only indexes are normalized to 100 in the first quarter of 1991. Note that normalization dates do not affect measured appreciation rates.

**17. Is the HPI adjusted for inflation?**

No, the HPI is not adjusted for inflation. For inflation adjustments, one can use the Consumer Price Index "All Items Less Shelter" series. The Bureau of Labor Statistics' price index series ID# CUUR0000SA0L2, for example, has tracked non-shelter consumer prices since the 1930s. That series and others can be downloaded at: <http://data.bls.gov/cgi-bin/srgate>.

**18. How do I use the manipulatable data (in TXT files) on the website to calculate appreciation rates?**

The index numbers alone (for census divisions and U.S., individual states, and MSAs) do not have significance. They have meaning in relation to previous or future index numbers, because you can use them to calculate appreciation rates using the formula below.

To calculate appreciation between any 2 quarters, use the formula:

$$(\text{QUARTER 2 INDEX NUMBER} - \text{QUARTER 1 INDEX NUMBER}) / \text{QUARTER 1 INDEX NUMBER}$$

You can generate annual numbers by taking the four quarter average for each year or monthly numbers by finding the difference between two months.

**19. How is FHFA's House Price Index constructed for MSAs? The website says that FHFA uses the 2013 definitions based on the 2010 Census to define each MSA. Is this true for all time periods covered by each index? Or do the definitions change over time as the Census expanded its MSA definitions? For example, if the definition of an MSA added three counties between 1980 and 2000, would the value of the index in 1980 cover the three counties that were not included in the 1980 SMSA definition?**

The HPI is recomputed historically each quarter. The MSA definition used to compute the 1982 (for example) index value in Anchorage, AK would be the most recent definition. The series is comparable backwards.

**20. How can the House Price Index for an MSA be linked to zip codes within that MSA?**

FHFA does not publish house price indexes for specific ZIP codes. Researchers are sometimes interested in associating the MSA-level index with specific ZIP codes, however.

Because ZIP codes sometimes overlap county boundaries, a single ZIP code can be located partially inside and outside of a Metropolitan Area. Thus, the development of a crosswalk between ZIP codes and Metropolitan Areas is not a straightforward exercise. The Department of Housing and Urban Development has released a lookup table that maps ZIP codes to the Metropolitan Area(s) that they fall within. That lookup file, as well as a discussion of the underlying technical issues, can be found here:

[http://www.huduser.org/portal/datasets/usps\\_crosswalk.html](http://www.huduser.org/portal/datasets/usps_crosswalk.html).

**21. How and why is the HPI revised each quarter?**

Historical estimates of the HPI revise for three primary reasons:

- 1) The HPI is based on repeat transactions. That is, the estimates of appreciation are based on repeated valuations of the same property over time. Therefore, each time a property "repeats" in the form of a sale or refinance, average appreciation since the prior sale/refinance period is influenced.
- 2) Fannie Mae and Freddie Mac (the Enterprises) purchase seasoned loans, providing new information about prior quarters.
- 3) Due to a 30- to 45-day lag time from loan origination to Enterprise funding, FHFA receives data on new fundings for one additional month following the last month of the quarter. These fundings contain many loans originating in that most recent quarter, and especially the last month of the quarter. This will reduce with subsequent revisions, however data on loans purchased with a longer lag, including seasoned loans, will continue to generate revisions, especially for the most recent quarters.

In connection with the release of the 2012Q2 HPI results, a special revision was made to two historical HPI values. In prior releases, the all-transactions index values for Vermont-1976Q1 and West Virginia-1982Q1 were both reported to be 100.01. Those values were not correct; index values for those respective periods should have been set to missing because no modeling data were available in the underlying sample. The HPI releases for 2012Q2 and later periods reflect the change.

## **22. What transaction dates are used in estimating the index?**

For model estimation, the loan origination date is used as the relevant transaction date.

## **23. Are foreclosure sales included in the HPI?**

Transactions that merely represent title transfers to lenders will not appear in the data. Once lenders take possession of foreclosed properties, however, the subsequent sale to the public can appear in the data. As with any other property sale, the sales information will be in FHFA's data if the buyer purchases the property with a loan that is bought or guaranteed by Fannie Mae or Freddie Mac.

## **24. How are the monthly House Price Indexes calculated?**

The monthly indexes are calculated in the same way the quarterly indexes are constructed, except transactions from the same quarter are no longer aggregated. To construct the quarterly index, all transactions from the same quarter are aggregated and index values are estimated using the assigned quarters. In the monthly indexing model, all transactions for the same month are aggregated and separate index values are estimated for each month.

## **25. How are the Census Division and U.S. House Price Indexes formed?**

As discussed in the Highlights article accompanying the 2011Q1 HPI Release (available for download at <http://go.usa.gov/8k5d>), the census division indexes are constructed from statistics for the component states. For the quarterly all-transactions and purchase-only indexes, the census division indexes are constructed from quarterly growth rate estimates for the underlying state indexes. Census division index estimates are “built-up” from quarterly growth rate estimates (monthly growth rates for the monthly index) for the component states.

The census division indexes are set equal to 100 in the relevant base periods. Then, the index values for subsequent periods are increased (or decreased) by the weighted average quarterly (or monthly) price change for the underlying states. Index values for periods before the base period are calculated in a similar fashion; beginning with the base period value, the preceding index values are sequentially determined so that the growth rate in each period always reflects the weighted average growth rate for the component states.

The national HPI is constructed in an analogous fashion, except that the weighted components are census divisions. Because the census divisions measures are themselves weighted averages of state metrics, the U.S. index is equivalent to a state-weighted metric.

## **26. What weights are used in forming the Census Division and U.S. Indexes?**

The weights used in constructing the indexes are estimates for the shares of one-unit detached properties in each state. For years in which decennial census data are available, the share from the relevant census is used. For intervening years, a state's share is the weighted average of the relevant shares in the prior and subsequent censuses, where the weights are changed by ten percentage points each year. For example, California's share of the housing stock for 1982 is calculated as 0.8 times its share in the 1980 census plus 0.2 times its share in the 1990 census. For 1983, the Pacific Division's share is 0.7 times its 1980 share plus 0.3 times its 1990 share.

For years since 2000, state shares are calculated as follows:

- For the 2001-2005 interval, shares are straight-line interpolated based on the state shares in the 2000 decennial Census and the 2005 values from the American Community Survey (ACS).
- For 2006-2012, the estimates are from the annual ACS.
- Until 2013 ACS estimates become available, shares from the 2012 ACS are used for subsequent periods.

The year-specific estimates of the state shares of U.S. detached housing stock can be accessed at <http://go.usa.gov/8k5F>.

**27. For those house price indexes that are seasonally adjusted, what approach is used in performing the seasonal adjustment?**

The Census Bureau's X-12 ARIMA procedure is used, as implemented in the SAS software package. The automated ARIMA model-selection algorithm in X-12 is employed, which searches through a series of seasonality structures and selects the first that satisfies the Ljung-Box test for serial correlation.

To obtain more information on the HPI contact us via the Data and Research Contact page at <http://go.usa.gov/8kN3>.

**28. How is the Expanded-Data HPI calculated?**

The approach to estimating the expanded-data HPI is detailed in the Highlights article published with the 2011Q2 HPI at <http://go.usa.gov/8kNm>. In general, the methodology is the same as is used in the construction of the standard purchase-only HPI, except a supplemented dataset is used for estimation. The augmented data include sales price information from Fannie Mae and Freddie Mac mortgages as well as two new information sources: (1) transactions records for houses with mortgages endorsed by FHA and (2) county recorder data licensed from CoreLogic. The licensed county recorder data do not include records in many U.S. counties—particularly rural ones. To ensure that the addition of the CoreLogic data to the estimation sample does not unduly bias index estimates toward price trends in urban areas, the expanded-data index for certain states is estimated by weighting price trends in areas with CoreLogic coverage and other areas. Details on this sub-area weighting can be found in the text of the Highlights piece referenced above.

**29. What is the “distress-free” index?**

FHFA released a “distress-free” HPI in 2012Q2 along with the Highlights article at <http://go.usa.gov/8kNJ>. The index is a version of the purchase-only index that removes short sales and sales of bank-owned properties from the transactions data used to compute that traditional index. The index is still in a developmental stage. An analysis of how distressed sales affect the FHFA HPI is provided in an FHFA Working Paper released August 2013 at <http://go.usa.gov/8kRB>.

# HOUSE PRICE INDEX (HPI) STATISTICAL REPORT

## Purchase-Only House Price Index

### **1<sup>st</sup> Quarter 1991\* to 4<sup>th</sup> Quarter 2014**

---

This report contains the index number and standard error for each quarterly census division and state HPI since the first quarter of 1991. The number in each column is the index number. The number in parentheses is the standard error, which indicates the relative precision of the index number estimate.

The higher the standard error, the larger the range of possible statistical error. Higher error numbers are generally associated with areas having relatively few repeat transactions and also with areas experiencing more pronounced economic cycles which can result in wide swings in house prices.

This report also contains house price volatility parameter estimates and annualized volatility estimates for each division and state index. The United States index is constructed to reflect the weighted average quarterly price change for the fifty states and Washington, D.C. The weights are the estimated share of one-unit detached housing units in the respective states. For details on the index methodology and derivation of standard errors and volatility estimates, see the paper *OFHEO House Price Indexes: HPI Technical Description*. This paper is available upon request from FHFA or at <http://www.fhfa.gov/PolicyProgramsResearch/Research/Pages/HPI-Technical-Description.aspx>.

**\*Note that, prior to the release of the 2009Q1 data, the index values reported in this section of the HPI report reflected the “all-transactions” HPI, which is estimated using sales prices and appraisal values.** The all-transactions indexes and the associated volatility parameters are still available for download at <http://www.fhfa.gov/DataTools/Downloads/Pages/House-Price-Index-Datasets.aspx#atvol>.

You may also inquire with House Price Index questions on the Data and Research Contact page at <https://www.fhfa.gov/AboutUs/Contact/Pages/Data-and-Research-Form.aspx>.
